

## ADHD Timmins

ADHD Timmins - Attention deficit disorder or also called ADD can have an effect on both adults and children. With children, it can present with them failing to focus at school, or making careless mistakes on assignments or during various activities. Individuals who deal with with this condition can often be accused of daydreaming and appearing not to listen when spoken to. They normally fail to complete tasks and have problems following instructions. It is common for them to exhibit too much distractibility and forgetfulness also. Losing items required to facilitate tasks and procrastination are other problems. Many kids with ADD also have a sort of an accent.

Adults who have ADD may have a lot of the above symptoms as well as having difficulty finishing projects which have been previously started, having trouble focusing on conversations, making careless mistakes when having to work on uninteresting or difficult projects and having difficulty organizing the completion of a task. Clutter is a common feature in houses or work spaces and even within the vehicle. Disorganized personal stuff, usually of no use to the person or old and worn out, may become a cluttered mess. Grown-ups can likewise have problems remembering obligations or appointments and could frequently change plans. These individuals can become very much distracted by activity or noise.

### Prevalence

As various nations diagnose the condition in different ways, it is difficult to say precisely how many children in the planet have ADD. It is likely that up to 10% of children in the US have ADD. It is present in roughly 1-5% of the world population. There are approximately 5 times more boys than girls who are diagnosed with ADD. This could be because boys are more likely to be difficult to manage and be overactive when they are handling attention problems.

### Treatment

As a way to help improve concentration, lots of individuals have traditionally turned to medication. The prescribed medicines may or may not work for the sufferer. In addition, a lot of symptoms can reoccur when the medication stops. The medications are in two categories, non-stimulants and stimulants. They can have extreme side effects too. Some of the usually prescribed stimulants comprise Vyvanse, Adderall and Ritalin. The non-stimulant medication is normally anti-depressant medications like for example Zoloft, Prozac and Wellbutrin.

Medication is not for everybody. Behavioural cognitive therapy is normally recommended to help improve social functioning, organizational skills and study techniques. Several people have found great success in reducing food colorings and additives in their food intake. Various individuals switch to a natural foods diet and avoid sugar too. New studies have shown that changes in diet can truly be effective. Much research is being done about the condition in order to help individuals deal better and learn to function at a more successful rate.
